

REMANUFACTURING

GREEN TECHNOLOGY MADE BY FTE AUTOMOTIVE

In 2011, inspired by its long-established commitment to engineering excellence in brake hydraulics and remanufacturing engineering, FTE Aftermarket launched a complete product line of in-house remanufactured brake calipers. Today FTE is the leading remanufacturer of brake calipers in Europe, offering more than 2,000 references.

By using Green Technology, FTE automotive acts environmentally sustainable. The remanufactured brake calipers which are produced in-house, therefore provide a safe, eco-friendly and cost-efficient solution as they conserve resources, help to protect the environment and supplement FTE automotive's expertise in the field of brake hydraulics.

FTE's remanufactured calipers are based on the recycling of old calipers. They are produced in our own modern European plant based on LEAN manufacturing principles. Each caliper is controlled and tested before leaving the factory, ensuring each meets the latest quality and environmental standards such as ISO 9001 and ISO14001, and customer-specific requirements such as TS16949.
